ANAL SAC DISEASE

When your dog scoots its rear end across the floor, it most likely isn't due to worms. Dogs scoot when their anal sacs are uncomfortable. Anal glands and anal sacs are part of normal canine anatomy.

Anal glands are scent glands located around a dog's anus, which produce a strong smelling, oily secretion. Anal sacs are located between the internal and external anal muscles, they store this secretion for territory marking. The anal sacs empty through 2 openings located on either side of the dog's anus. When the anus is stretched as stool passed, the muscles squeeze the anal sacs and force the contents onto the surface of the stool.

When dogs greet each other with familiar sniffing, the secretion from the anal gland is what they are smelling. Anal sacs vary in size based on the breed of the dog, but generally healthy anal sacs range in size from a pea to a kidney bean.

Problems occur when the sacs get too full and impacted. If the contents of the anal sacs are not emptied on a regular basis during the act of passing stool, the normally liquid contents become very thick and plug the openings of the anal sacs. The impacted glands can cause discomfort or worse they can get infected resulting in an abscess. Fluid from a normal anal sac does NOT have a pleasant smell, but if infected the smell can be overwhelmingly bad.

To ensure that the anal sacs are emptying properly, have them checked on a regular basis. This is a simple and painless procedure. It becomes more difficult and painful to empty the anal sacs when the contents begin to thicken. To prevent them from impacting the veterinarian can show you how you may empty your dogs anal sacs on a regular basis.³

If you are unsure if your dog needs their anal sacs emptied, watch their behavior. Dogs with impacted anal glands will often scoot their rump, or they may look, lick, and/or bite at their anus. What predisposes some dogs to anal sac abscesses is unknown. Dogs that are obese tend to have more problems than physically fit dogs. This may be due to fat skin folds blocking the pores and preventing them from draining, or because it's difficult for the obese dog to groom itself and encourage natural drainage. If your dog repeatedly develops anal sac abscesses the sacs can be removed surgically.
